S'-CACGTG-3' AND, WITH HIGHER AFFINITY, TO 5'-CACGCG-3'.
SUBUNIT: EFFICIENT DNA BINDING REQUIRES DIMERIZATION WITH ANOTHER
BHLH PROTEIN. BINDS DNA AS N HOMODIMER OR A HETERODIMER WITH MAX.
SUBCELLULAR LOCATION: NUCLEAR.
STMILARITY: BELONGS TO THE BASIC HELIX-LOOP-HELIX (BHLH) FAMILY OF
TRANSCRIPTION FACTORS. BHLH-ZIP SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 TISSUE-EMBRYO;

 The bevelopmental expression of nicein adhesion protein (laminin-5)

The aubunits suggests multiple morphogenic roles.";

The aubunits restraceLudar Marint Components by interacting cells;

The aubunits rathanal marint components by interacting cells. The process and preserved multiple roles.

The aubunits rathanal marint components by interacting of three phosphogration of process and preserved with a role for a complex glycopropering consisting of three phosphogration of the aubunit is a complex glycopropering complex glycopropering complex glycopropering the aubunity. The alpha-3 chain is a suguring the aubunits and possibly also a component of Laminin's component of Laminin's component of Laminin's component of the aubunits and component.

The alpha-3 chain sylor component;

The alpha-3 chain is a suguring a component of Laminin's component of the aubunits and a component.

The alpha-3 chain is a suggest and a component of Laminin's component of the aubunity.

The alpha-3 chain is a suggest and a component of Laminin's component of the aubunity.

The alpha-3 chain is a suggest and a component of Laminin's component of the aubunity.

The alpha-3 chain is a component of Laminin's component of the aubunity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This SWISS-PROT entry is copyright. Direct Submission Submitted (16-SEP-1999) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA on Sep 22, 1999 this sequence version replaced gi:5916428.

* NOTE: This is a 'working draft' sequence. It currently consists of 89 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as as soon as it is available and the accession number will
                                                                                                                                                                                                                                                                                                                                                                                              831 bp in length

LOCUS MXA132503 4513 bp DNA BCT 01-JUL-1999
DEFINITION Myxococcus xanthus taB, taC, taD, taE and taF genes.
ACCESSION AJ132503.1 GI:5419951
KEYWORDS ACP synthase; acyl carier protein (ACP); membrane associated protein; taB gene; taC gene; taD gene; TaF gene.
SOURCE Myxococcus xanthus.
ORGANISM Myxococcus xanthus
Bacteria; Proteobacteria; delta subdivision; Myxobacteria;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              to: 268369

'U'. The source of the chromosomes was a human/hamster hybrid,
GMO7297-F, from Robert Nussbaum at the University of Pennsylvania
School of Medicine. Please contact the Lawrence Livermore National
Laboratory at http://www-bio.llnl.gov/genome to obtain the clone.

/note-"MLCB2533.01c, ansP, probable L-asparagine permease, partial CDS, lan: >366 as; highly similar to many amino-acidemeases e.g. ANSP_SALTY (EMBL:U04851)
S. Lyphimurium AnsP, L-asparagine permease (I-asparagine transport protein) (497 aa), fasta scores; opt: 1508
z-score: 1696.8 E(): 0, 61.2% identity in 366 aa overlap. Equivalent to M.tuberculosis Rv2127, ansP (MTCY561.26, BS.7% identity in 356 aa overlap). Also similar to M.tuberculosis permease Rv0346c, aroP2 (MTCY13E10.06c, 75.1% identity in 345 aa overlap). Probable integral membrane protein, contains PS00218 Amino acid permeases signature. Pfam match to entry PF00324 aa_permeases acid permease. Annotated as ORF TR:049801, designated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /yeuc-
muczez auszz / naspz, probable L-asparagine permease, len: 505 aa; highly similar to many amino-acid permeases e.g. ANSP_SALTY (EMBL:104881) S.typhimurium Ansp. L-asparagine permease (L-asparagine transport protein) (497 aa), fasta scores;opt: 1891 z-score: 2218.9 E(): 0, 58.9% identity in 477 aa overlap. Equivalent to M.tuberculosis Rv2127 (MTCV261.26, 83.7% identity in 485 aa overlap). Also similar to M.tuberculosis permease Rv0346c (MTCX13E10.06c, 69.8% identity in 473 aa overlap). Probable integral membrane protein, contains PS00218 Amino acid permeases signature. Pfam match to entry PF00324 aa_permeases, amino acid permease. Concess were identified by a combination of three methods: Gene prediction programs including GRAIL (available by anonymous ftp from arthur.epm.orn.gov), Genefinder (Phil Green, University of Washington), Genscan (Chris Burge,
http://gnomic.stanford.edu/-chris/GENSCANW.html), and NetPlantGene (http://www.bss.dtu.gk/netpgenec/basnetpgene.html), saarches of the complete sequence against a peptide database and the Arabidopsis BST database at TIGR (http://www.igr.org/tdb/at/at.html).
Annotated genes are named to indicate the level of evidence for their annotation. Genes without significant peptide similarity but with BST similarity are named as 'unknown' proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their length are predicted by tRNAscan-SE (Sean Eddy, that are predicted by tRNAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE). Simple repeats are identified by repeatmasker (Arian Smit, http://ftp.genome.washington.edu/RW/RepeatMasker.html). Regions of genomic sequence that are nonctated as genes but have predicted exons by GRAIL are annotated as misc features.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /translation="MKQNIVAVDILLNQMRDRNIKLDSFVVSAIIETNCDRCRTEGAS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       User Submission

Ly Submitted (104-AUG-1999) Sanger Centre, Hinxton, Cambridgeshire, CBIO 15A, UK. Email enquiries: humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk

On May 11, 1999 this sequence version replaced g1:4741514.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em:, EMBL; Sw.; SWISSPROT; Tr.; TREMBL
This sequence is the entire insert of clone 782123. This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known and repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               complement(join(<26. .108,605. .639,2393. .2486,4942. .5082,6225. .6285,6755. .6842,16087. .16197,16754. .16955,108085. .18225,21673. .181818,24949. .24662,28335. .28988. .29925,311933. .1865,33057. .33107,36418. .36490,

No attempt has been made to order or orient the contigs relative to one another correctly before concatenating. At each location in the sequence where contigs have been joined, several consecutive Ns may have been inserted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Direct Submissible

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A single-stranded DNA (or its complementary strand or the corresp. A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 GS" sequences given in T19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or MRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-criented conNa hybridise with specific mRNA. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                05-MAK-1998 (first entry)

Therapy and diagnosis

Disclosure; Fig 13: 89pp; German.

This sequence is used in a method which results in the production of This sequence is used in a method which results in the method involves Generating a heterogeneous population of D-nucleic acids then treating them with optical antipodes. Such nucleic acids are are useful in therapy and diagnosis, as e.g. biosensors, herbicides, food additives, in the analysis of perfumes or flavourings and in cosmetics, for formulating and inspiration of the target molecule and can be coupled to markers or cyctoxins, carriers for affinity purification of the target molecule, including separation of enantioners or elimination of cantinomeric impurities, or they can be used for purification of centinomeric impurities, or they can be used for purification of centinomeric calls, e.g. the separation of toxic components by dialysis. The nucleic calls can be used in therapeutic applications for eq. for tumours, viral and bacterial infections and ffor hypertension. The method allows selection and evaluation of high affinity nucleic acids.

The conditions than compounds with the natural configuration (particularly or nucleic acids and the case of RNA). This stability means that potentially harmful metabolites are not formed and immune responses are not induced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Location/Qualifiers

    Polynucleotide(s) and proteins derived from Staphylococcus aureus wit: 9737492453.

Polynucleotide(s) and proteins derived in the production of atoric and a second on computer readable medium and used in the production of Taim 1; Page 1260-1261; 3271pp; English.

Claim 1; Page 1260-1261; 3271pp; English.

Cot the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (RAM) or DY-ROM; Homology searches using the S.aureus. DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be obtained specifically, sequences which are be used in a vaccine composition against S.aureus in the sample. S.aureus is implicated in numerous human diseases, or including cellulitis, eyelid infections, food poisoning, osteomyelitis, syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences contained on the composition of computer readable medium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            28-JUL-1997 (first entry)

Claim 1; Page 413-414; 2084pp; English.

A computer readable medium has been developed which has recorded on it 982 nucleotide sequences isolated from the Enterococcus faccalis genome. X12938 to X13919 represent these nucleotide sequences which are primary nucleotide sequences. also known as contigs. The computer-based system commercial importance. The Enterococcus faccalis genome with commercial importance. The products can be used to detect the presence of Enterococcus faccalis in samples. They can also be used for progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of Enterococcus faccalis, or
                                                                                                                                                  Preph. of active lipase in high quantities - by subjecting to denaturation and restructuring in presence of chaperone molecule Example 10; page 43; 78pp; English.

Two genes were cloned and sequence from Pseudomonas cepacia DSM 3401. The genes were designated lipD (Q44280) and limD (Q44281) and they code for a lipase and a lipase modulator protein, respectively. Due to the extreme GC content of the DNA, the sequence was difficult to determine (hence the "Others" in the sequence). The limD start codon is positioned 3 by downstream of the lipD stop codon. LipD and LimD were found to be homologous to LipA and LimA, respectively. In denaturation/renaturation experiments, LimA chaperone protein was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated Enterococcus faecalis polynucleotides and polypeptides - used to develop products for the detection of Enterococcus and for use in vaccines for prevention or attenuation of Enterococcus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                19-MAR-1999 (first entry)

Claim 1, Page 1853-1855; 2084pp; English.

A computer readable medium has been developed which has recorded on it
982 nucleotide sequences isolated from the Enterococcus faecalis genome.
X12938 to X13919 represent these nucleotide sequences which are primary
nucleotide sequences, also known as contigs. The computer-based system
can identify fragments of the Enterococcus faecalis genome with
commercial importance. The products can be used to detect the presence
of Enterococcus faecalis in samples. They can also be used for
diagnosing Enterococcus in samples. They can also be used for
modulate the growth or pathogenicity of Enterococcus faecalis, or
modulate the growth or pathogenicity of in vitro. In particular the
polypeptides encoded by the Enterococcus faecalis nucleotide sequences
can be used in vaccines to prevent or attenuate an Enterococcal
particular the nucleotide sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         HUMA.)  claim 4; Pages 28:31; 31pp; English.

This cDNA encodes an isoform of the EXT2 gene associated with hereditary multiple exostoses and chondrosarcona. The polynucleotide is an isoform of the EXT2 gene described in Nature Genet., 14, 25, 1996. The polynucleotide can be used in the detection and treatment of EXT2-related diseases, and to identify compounds which activate or inhibit receptors for the encoded polypeptide. The polypeptide can be recombinantly the encoding nucleic acid.

They can also be used for diagnosing Enterococcus infection in an animal and monitoring progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of Enterococcus faecalis, or another related organism, in vivo or in vitro. In particular the polypeptides encoded by the Enterococcus faecalis nucleotide sequences contains an ease of the contains and modulate the contains and modulate the contains and c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                12-NOV-1998; U08985.

Non-A, non-B, non-C, non-D, non-E Hepatitis virus reagents - useful
for diagnosis and therapy of hepatitis GB virus
Example 5: Page 193: 661pp; English.

Double stranded hepatitis GB virus (HGBV) DNA obtd. from HGBV
infected tamarin plasma, using standard procedures, was used to
infected tamarin plasma, using standard procedures, was used to
repare a lambda phage HGBV CDNA ilbrary. The cDNA cinon T00049,
which encodes the proteins R81447-50 and R82064/65 (the 6 possible
reading frames), was rescued from the lambda phage, searched
against a sequence database and found to be an unique HGBV
sequence. Reagents which comprise the HGBV DNA, or its protein
prods. can be used for the diagnosis, therapy or in a vaccine to

Non-A, non-B, non-C, non-D, non-E Hepatitis virus reagents - useful for diagnosis and therapy of hepatitis GB virus
Example 9; Page 286; 661pp; English.

Double stranded hepatitis GB virus (HGBV) DNA obtd. from HGBV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Infected tamarin plasma, using standard procedures, was used to prepare a lambda phage HGBV CDNA library. CDNA clones rescued from the lambda phage were searched against a sequence database and found to be unique HGBV sequences. Then a series of PCR experiments were performed to obtain additional HGBV sequences, i.e. T00126-28. Reagents which comprise the HGBV DNA, or its protein prods. can be used for the diagnosis, therapy or in a vaccine to prevent HGBV infection.
